

Search for instructional materials more efficiently with **Smart Search**

Teachers have limited time in their day to spend searching and browsing for materials. Now with Smart Search, instructional materials are recommended based on the sections they teach, upcoming planned instruction, performance on recent assessments, and popularity. Smart Search dramatically reduces the time to find the most effective and appropriate instructional materials.

Recommendations of instructional materials are provided based on:

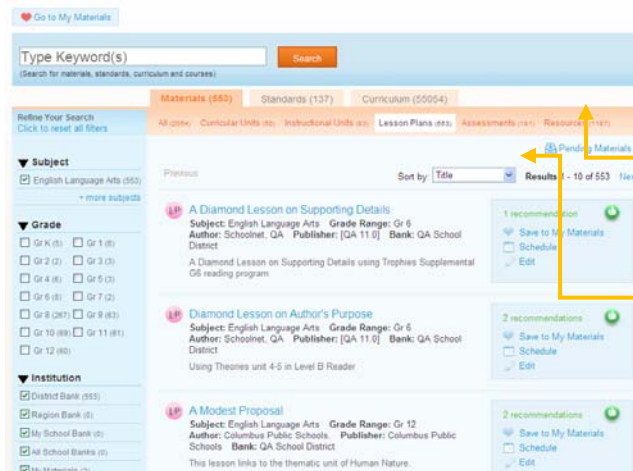

Upcoming assessments (materials aligned to standards on upcoming test that had the lowest mastery rate)

Upcoming instruction (materials aligned to standards in materials that have been scheduled on teacher's lesson planner)

Recent assessment results (materials aligned to standards on recent test that had the lowest mastery rate)

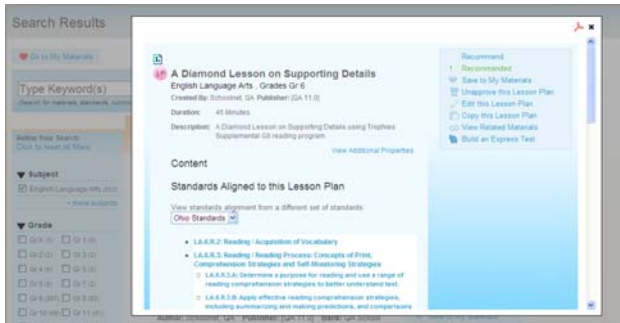

Popularity (recommendations made by other teachers and instructional staff)

A simplified search interface with pre-population of subjects and grade levels based on a teacher's sections and the ability to search in specific material banks:

Ability to search for multiple material types in a single experience

New sorting options like popularity, highest ranked, and institution banks

← Ability to preview materials before leaving the materials search area
